Sizes of things

	Binary		Decimal		Example
Bit	2^0	1			Binary (0 or 1)
Byte (B)	2^3	8			"S" = 01010011
Kilobyte (KB)	2^{10}	1,024	10^3	1,000	Word Document
Megabyte (MB)	2^{20}	1,048,567	10^6	1,000,000	Digital Photo
Gigabyte (GB)	2^{30}	1,073,741,824	10^9	1,000,000,000	DVD
Terabyte (TB)	2^{40}	1,099,511,627,776	2^{12}	1,000,000,000,000	Hard Drive
Petabyte (PB)	2^{50}	1,125,899,906,842,624	2^{15}	1,000,000,000,000,000	Some of Facebook
All Atoms	2^{266}	$\cdots$	10^{80}	$\cdots$	Universe
TSP routes	2^{329}	$(71-1)!/2$	10^{99}	$\cdots$	71 cities

Objectives

1. Learn what a RDBMS is
2. Learn the ways tables can be joined
3. Learn some postgreSQL
   - create, alter, insert-delete-update, and drop tables
4. Learn more postgreSQL
   - SELECT
   - AS, DISTINCT
   - *, /, +, -, CONCAT, ROUND, CAST, COALESCE
   - WHERE, CASE WHEN THEN ELSE END
   - =, <, <=, >, >=, != , <>, AND, OR, BETWEEN, LIKE, IN
   - NULL, IS NULL, IS NOT NULL
   - FROM/JOIN ON, LEFT, RIGHT, FULL [OUTER]
   - GROUP BY, MAX, MIN, SUM, AVG, COUNT
   - HAVING, ORDER BY, LIMIT
   - (SELECT ...)
5. Practice, practice, practice...

Relational Database Management System (RDBMS)

- Efficient queries of data and relations therein

Relational Database Management System (RDBMS)

- Efficient queries of data and relations therein
- *Schema*: tables and typed data columns
  - *Keys*: data relationships

Relational Database Management System (RDBMS)

- Efficient queries of data and relations therein
- *Schema*: tables and typed data columns
  - *Keys*: data relationships
- *ACID*: reliability properties

A: Atomicity – "all or nothing"
C: Consistency – "remain in legal state"
I: Isolation – "appropriate independence"
D: Durability – "persistance" (non-volatile storage)

Relational Database Management System (RDBMS)

- Efficient queries of data and relations therein
- *Schema*: tables and typed data columns
  - *Keys*: data relationships
- *ACID*: reliability properties

  A: Atomicity – "all or nothing"
  C: Consistency – "remain in legal state"
  I: Isolation – "appropriate independence"
  D: Durability – "persistance" (non-volatile storage)

- psql \l \c <DB> \d [table]

Schema

```
CREATE DATABASE dbname;
CREATE TABLE users {
    id INTEGER PRIMARY KEY,
    name VARCHAR(255),
    age INTEGER,
    city VARCHAR(255),
    name VARCHAR(2)
}
```

Schema

```
CREATE DATABASE dbname;
CREATE TABLE users {
    id INTEGER PRIMARY KEY,
    name VARCHAR(255),
    age INTEGER,
    city VARCHAR(255),
    name VARCHAR(2)
}
```

- Whitespace doesn't matter

  (but it can help make code clearer)

Schema

```
CREATE DATABASE dbname;
CREATE TABLE users {
    id INTEGER PRIMARY KEY,
    name VARCHAR(255),
    age INTEGER,
    city VARCHAR(255),
    name VARCHAR(2)
}
```

- Whitespace doesn't matter

  (but it can help make code clearer)
- Capitalization (often) doesn't matter

  (but it can help make code clearer)

Schema

```
CREATE DATABASE dbname;
CREATE TABLE users {
    id INTEGER PRIMARY KEY,
    name VARCHAR(255),
    age INTEGER,
    city VARCHAR(255),
    name VARCHAR(2)
}
```

- Whitespace doesn't matter

  (but it can help make code clearer)
- Capitalization (often) doesn't matter

  (but it can help make code clearer)
- Don't look like a noob
  - follow ubiquitous conventions
  - write beautiful looking code

Schema *efficiency* (referenced "users" table on last slide!)

```
CREATE TABLE visits {
    id INTEGER PRIMARY KEY,
    created_at TIMESTAMP,
    user_id INTEGER REFERENCES users(id)
    -- place foreign keys on the "many"
    -- side of a one-to-many relationship
};
```

Schema *efficiency*

```
CREATE TABLE visits {
    id INTEGER PRIMARY KEY,
    created_at TIMESTAMP,
    user_id INTEGER REFERENCES users(id)
    -- place foreign keys on the "many"
    -- side of a one-to-many relationship
};
```

```
CREATE TABLE posts {
    id INTEGER PRIMARY KEY,
    title VARCHAR(255)
};
```

```
CREATE TABLE tags {
    id INTEGER PRIMARY KEY,
    tag VARCHAR(255)
};
```

```
CREATE TABLE posts_tags {
    post_id INTEGER REFERENCES posts(id),
    tag_id INTEGER REFERENCES tags(id)
    -- "Normalized" data only duplicates foreign keys
};
```

Schema *efficiency* example

Do you like *this?*

My new Jawdins	#fab
My new Jawdins	#shoes
My new Jawdins	#fashion
Subway shoes	#shoes
Subway shoes	#envy

Or do you like *this?*

1	Tip-toein' in my Jawdins
2	NYC Subway Shoes

1	a
1	b
1	c
2	b
2	d

a	#fab
b	#shoes
c	#fashion
d	#envy

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- alter tables
- insert records
- update records
- delete records
- query records within and across tables

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- **create tables** (we saw this previously)
- alter tables
- insert records
- update records
- delete records
- query records within and across tables

```
CREATE DATABASE <dbname>;
CREATE [TEMPORARY] TABLE table AS <SQL query>;
```

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- **alter tables**
- insert records
- update records
- delete records
- query records within and across tables

```
ALTER TABLE table [DROP/ADD/ALTER] column [datatype];
```

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- **alter tables**
- insert records
- update records
- delete records
- query records within and across tables

```
DROP TABLE table;
```

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- alter tables
- **insert records**
- update records
- delete records
- query records within and across tables

```
INSERT INTO table [(c1,c2,c3,...)] VALUES (v1,v2,v3,...);
```

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- alter tables
- insert records
- **update records**
- delete records
- query records within and across tables

```
UPDATE table SET c1=v1,c2=v2,...WHERE cX=vX;
```

Structured Query Language (SQL)

SQL is used to interact with RDBMS, allowing one to

- create tables (we saw this previously)
- alter tables
- insert records
- update records
- **delete records**
- query records within and across tables

Declarative Language: *say what – not how*

The details of how things are actually done is just left up to SQL

My never ending query: What are we MISSING??

```
SELECT CONCAT(AVG(ROUND(100*c3/CAST(c2 AS REAL),2)),'%'),
    CASE WHEN –THEN 'a' WHEN – THEN 'b' ELSE 'c' END AS clm
    FROM table t LEFT JOIN table2 t2 ON (t.id = t2.id2)
        WHERE (t.c4 <= 70 OR t2.c4 LIKE 'S%') AND clm IN ('a','c')
                (AND CASE - - - END OR t2.id2 IS NULL)
        GROUP BY c2
        HAVING AVE(c1) > (SELECT COUNT(DISTINCT c5) FROM t3
                                WHERE c5 BETWEEN 'J' AND 'M')
    ORDER BY 1
    LIMIT 1;
```

Conclusion (and SUPER HINT)

It doesn't cost anything to

CREATE TABLE table AS (SELECT ...)

use it, and then

DROP TABLE table

And there's also that TEMPORARY thing that's totes cool/usable
