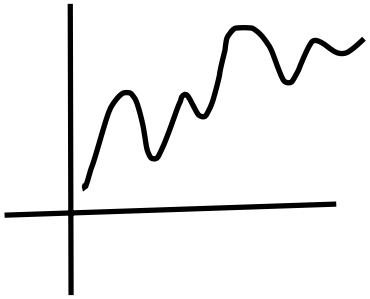
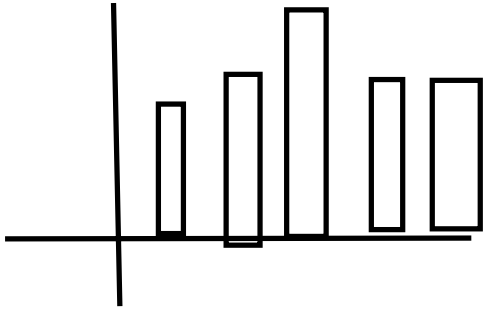
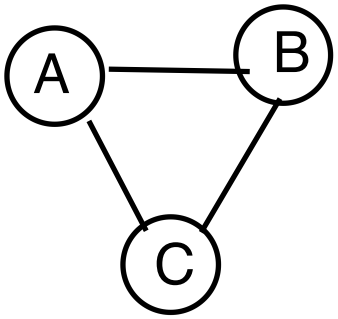
Graph Theory

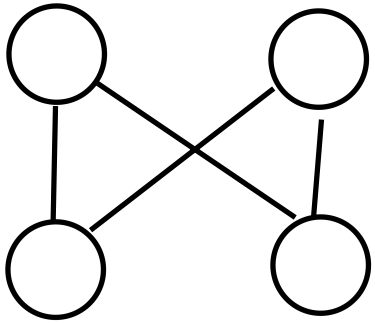
Darren Reger Lecture for Galvanize DSI

What is a graph?









Order
Size

Order
Size

$G = (V,E)$

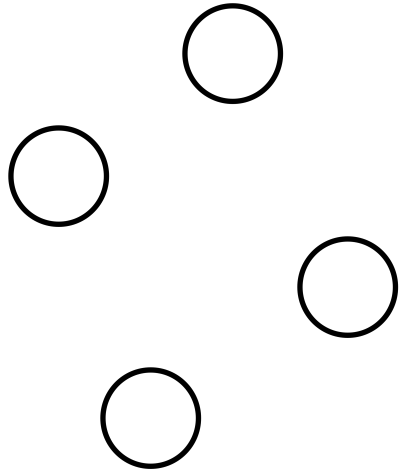
V=

E=

V is a (finite) set of elements
E is a sets of 2 subsets of V

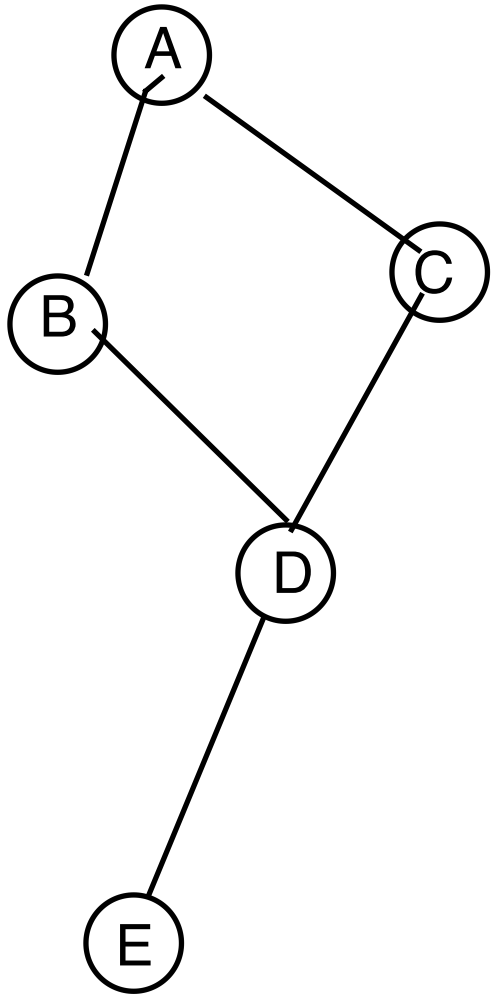
Simple graphs

Loops
Multiple Edges



Terminology

Neighbors
Degree
Path
Complete
Connected
Subgraph
Conn. Component

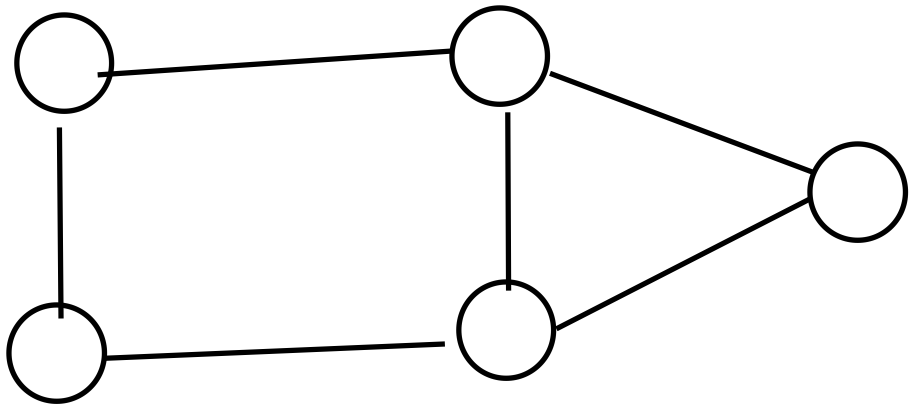


Types of Graphs

Directed

Undirected

Weighted



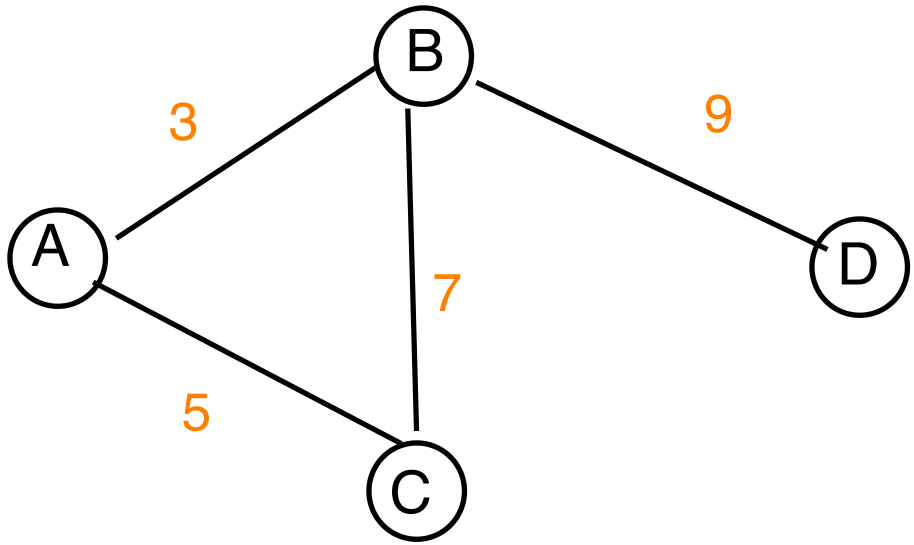
How do we represent graphs in our computer?

Edge List

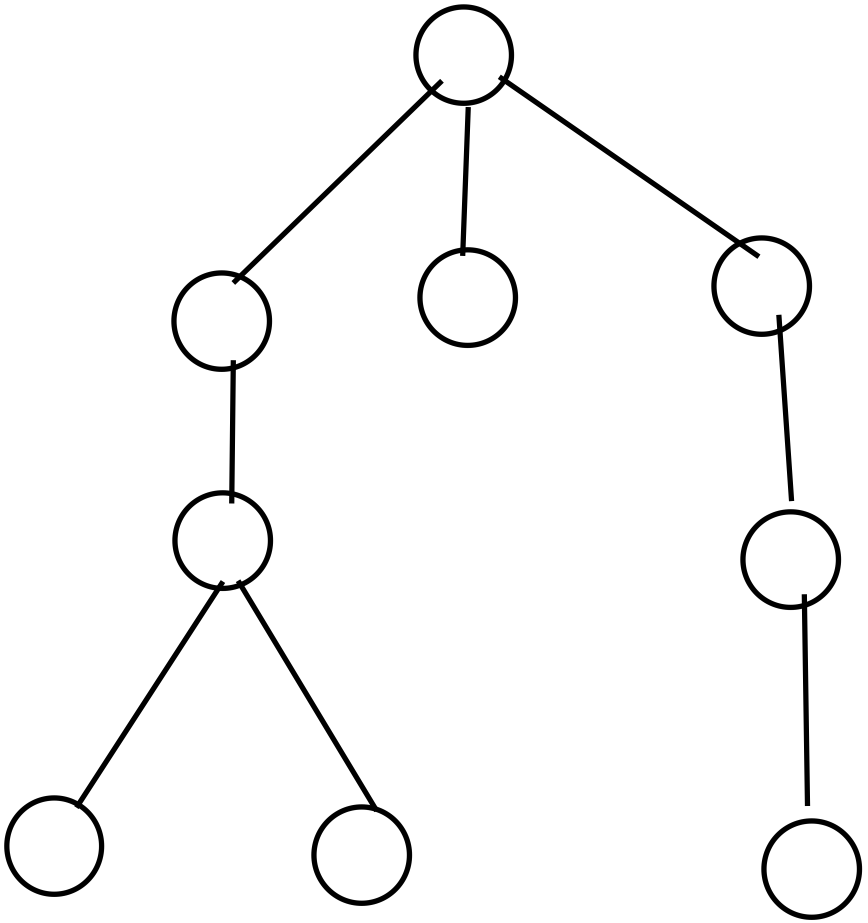
Adjacency Matrix

	A	B	C	D
A				
B				
C				
D				

Adjacency list



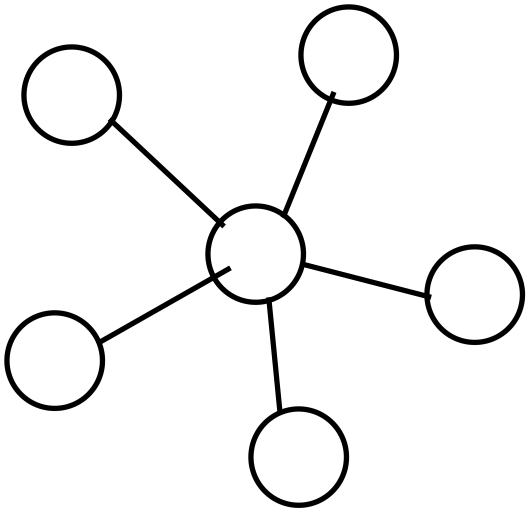
Breadth First Search



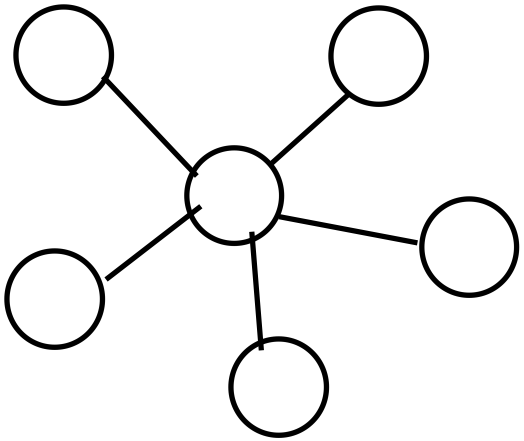
How Important Is a Given Node?

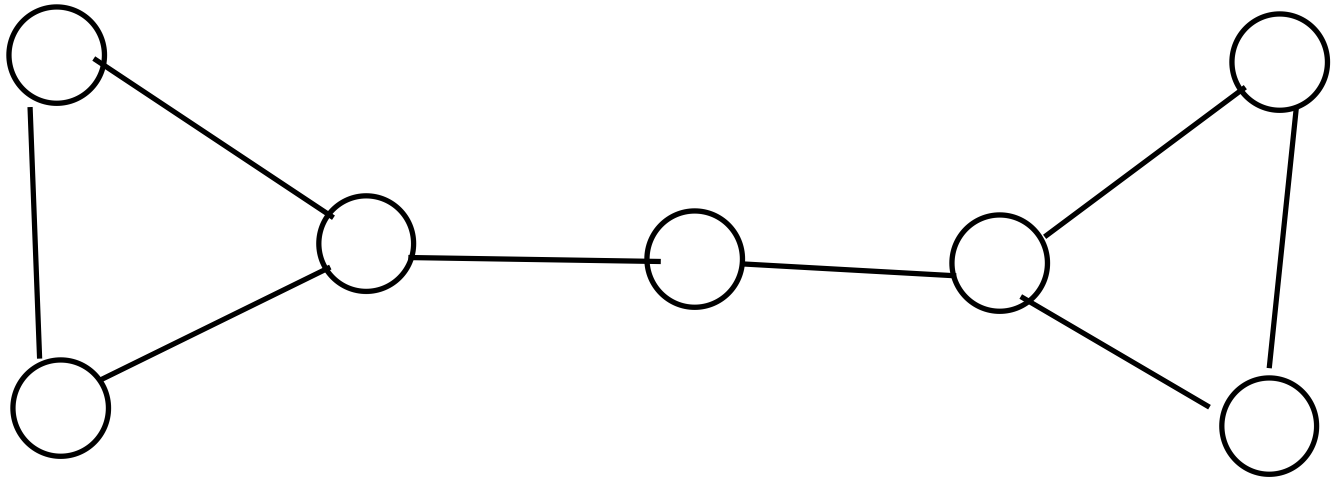
Centrality

Degree - # of Connections



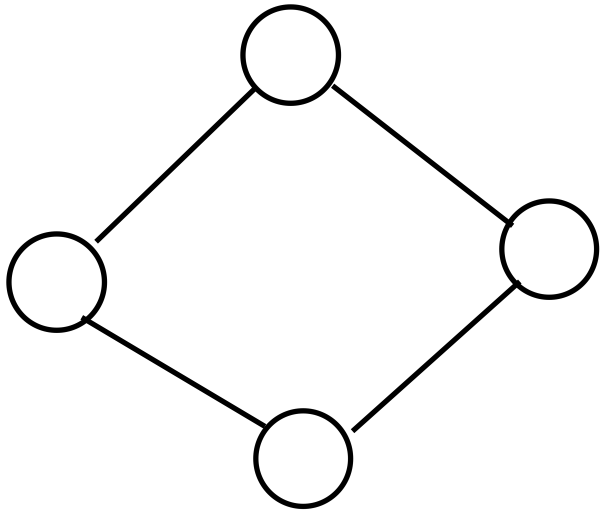
Normalize - divide by # of nodes





Betweenness Centrality

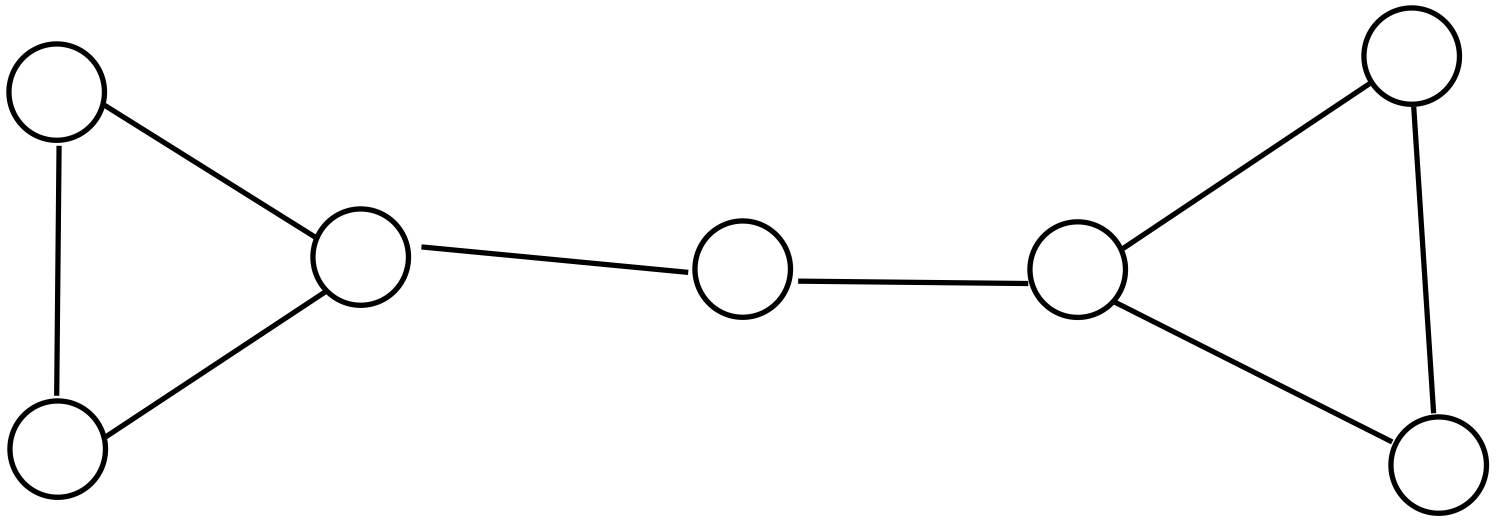
$$C_B(i) = \sum_{i \neq j \neq k} \frac{g_{jk}(i)}{g_{jk}}$$



Normalized -

Divide by # of pairs of vertices excluding the vertex itself

$$C'_B(i) = \frac{C_B(i)}{[(n-1)(n-2)/2]}$$



Eigenvector Centrality

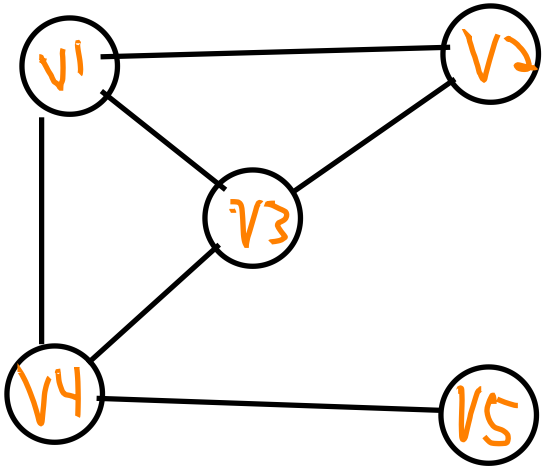
$$C_e(i) = \frac{1}{\lambda} \sum_{j=1}^{n} A_{j,i} C_e(j)$$

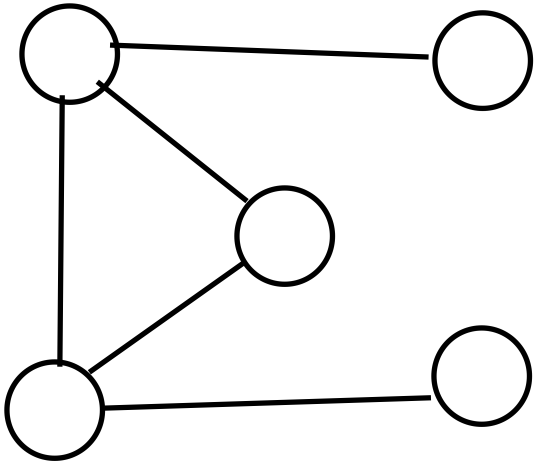
$$\mathbf{C}_e = \left(C_e(i), C_e(j), C_e(k), \ldots, C_e(n)\right)^T$$

$$\lambda \mathbf{C}_e = A^T \mathbf{C}_e \implies \lambda V = AV$$

Which eigenvector?

Perron-Frobenius Theorem





$$Ax = \begin{bmatrix} \end{bmatrix} \begin{bmatrix} \end{bmatrix} = \begin{bmatrix} \end{bmatrix}$$

Communities

Mutual Ties - within the group know each other

Compactness - reach other members in few steps

Dense Edges - high frequency of edges within groups

Separation from other groups - frequency within groups higher than out of group

F

Modularity

Measure that defines how likely the group structure seen was due to random chance

Modularity = Q = $\sum$ (Observed fraction of links within the group — Expected fraction of links in the group)

$$Q = \frac{1}{2m} \sum_{c \in C} \sum_{i,j \in c} A_{ij} - \frac{d_i d_j}{2m}$$

Graph Partitioning Problem

It's combinatorial!

$B_{20} \approx$

Heuristic Approach

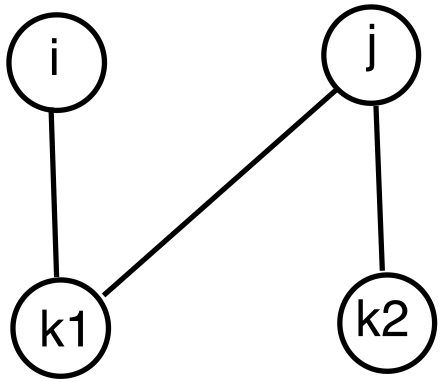
Focus on the edges that connect communities

Girvan-Newman 2004

For all edges, compute the edge betweenness and
remove the edge with the largest edge betweenness

Node Similarity

The # of neighbors that 2 nodes share



Hierarchical Clustering

Assign each vertex to a group of it's own

Find 2 groups with the highest similarity and join them together

Calculate the similarity between groups:

1) single linkage
2) complete linkage
3) average linkage

Repeat until all in 1 group
